Role-Based Auth

Sprint Management

PROBLEM STATEMENT

When small software teams run sprints using separate tools for task tracking and retrospectives, they struggle to connect completed work to structured team reflection — retros become an afterthought, happen in the wrong tool, or get skipped entirely.

TARGET USER

A **project manager or tech lead** on a team of 4–8 developers running 1–2 week sprints, who currently uses Jira (or equivalent) for task tracking but has no consistent retrospective process tied to sprint completion.

CORE VALUE PROPOSITION

A single shared workspace where sprint execution and anonymous retrospective feedback are one integrated flow — **closing a sprint automatically surfaces a retro**, grounded in the tasks that just happened.

MINIMUM VIABLE FEATURE SET

1

Sprint Kanban Board

Role-based access — Project Managers manage the sprint; Developers move task cards across To Do / In Progress / Done columns.

2

Sprint Completion Trigger

PM closes the sprint, which locks the board and unlocks a 3-question anonymous retro form for all team members.

3

Retro Results Dashboard

PM sees aggregated anonymous responses displayed alongside the sprint's completed task list.

Core Assumption

Retrospective quality improves when feedback is prompted immediately at sprint close and anchored to visible task history, rather than scheduled separately.

HOW TO VALIDATE

Run two consecutive sprints with a small team. Sprint one: retro via existing method. Sprint two: retro via this tool's triggered flow. Compare participation rate, whether responses reference specific tasks, and whether action items are more concrete. If two of three improve — the assumption holds.
